

Onsite Presentation - FDE

Technical Challenge: Cursor Cloud Agent and SDK Prototype

Overview

- 30-minute live demo
- 15-minute Q&A
- 15-minute live demo extension

The Prompt

Build a prototype using the Cursor Cloud Agent with a custom environment or Cursor SDK that solves a meaningful problem within the Software Development Life Cycle of an enterprise organization (industry of your choice). This excludes, Automations, BugBot or Security Review.

Your prototype should demonstrate how Cursor can be used to meaningfully improve a real-world software development workflow. Be ready to demo your working prototype, walk through your architecture, discuss design decisions and trade-offs, and extend a part of your solution live.

Expectations

We're looking for a thoughtful, intentional solution that focuses on solving a well-defined problem. Your prototype should clearly demonstrate how Cursor solves the problem statement you selected. Strong submissions are well-scoped, opinionated, and grounded in real enterprise constraints.

Example Problem Spaces

These are examples to spark ideas -- you're not limited to these:

- Build a new customer application while maintaining the current legacy application in parallel

- Maintain and upgrade customer applications in different environment with different configurations over time
- Rebuild an application on top of a new API version

During the Live Session

Please be prepared to:

- Explain the problem you chose and why it matters in an enterprise context
- Walk us through your working prototype
- Discuss key design decisions and trade-offs
- Highlight limitations and how you would evolve the solution
- Extend a part of your prototype based on a prompt from the interviewers

Optional Prep Call

You'll have an option for a 15-min prep-call before your onsite to answer questions about the format, the SDK, or Cloud Agent capabilities. No obligation. Let me know when providing your availability and we'll look to book it within the availability provided.
